

## SonicIntegration

- On-demand data exchange
- Integrate with existing software applications
- Bi-directional data transfer capabilities
- Reduce manual data entry
- Reduce costs associated with paper-based processes
- Provide employees with up-to-date information

With Sonic Enterprise, integrating can be as simple as transferring labor hours to payroll or as advanced as having a bi-directional exchange of information between your workforce and multiple business applications.

Utilizing SonicIntegration, SonicEnterprise becomes the central source of data exchange between your key business applications. This provides management with up-to-date information allowing them to make better business decisions.

**Data collection:** Our hardware products not only provide traditional time clock functionality, but can also provide your employees with the ability to edit their time all-at-once using the Sonic Clock's built-in timesheet editor.

**Payroll:** The payroll integration module offers integration options to payroll applications as well as outsourced service providers. Employee time is collected, approved and stored in one location eliminating the need to manually re-enter or transfer this information. Once configured, the integration module processes the data and creates a file that is ready to upload to payroll.

**Job Costing:** The job cost integration provides your employees with detailed project structure, allowing them to accurately allocate their time. The bi-directional link retrieves project detail and category codes while uploading approved labor hours and expenses to the appropriate cost codes.

## SonicIntegration

**Accounting:** Cost centres can be easily associated with functions or labor types for GL integration using the accounting integration module. Simply create user-defined labour types and map these definitions to the appropriate chart of accounts. This process provides employees with an easy to use interface while eliminating manual GL entries.

**Human Resources:** Integration to HR management software reduces the amount of time normally associated with employee time clock enrollment and ensures up-to-date employee information. Companies can also provide employees with access to existing HR self-service applications directly from the Sonic Clock. The Sonic Clock can either be configured to run Windows-based applications or access can be established using a web browser.

**Health & Safety:** Sonic Clock can act as an additional layer of protection to ensure a safer environment in your company. Provide employees with access to information such as operating instructions and manuals, guidelines and procedures, or create a direct link for employee access to health and safety applications.

**Quality Assurance:** Provide your employees with access to on-line knowledge bases, technical manuals and troubleshooting guides by configuring the custom document links. A document, web page, PDF or CAD drawing can be added and indexed to allow for instant reference.
